3.0 Responsive Web Design using media query
4.0 HTML Forms
5.0 Challenge

HTML page

Download the provided text and image files.

Create scone.html page that looks like the following using HTML5 semantics elements.

SOC

Scones: the most resplendent of snacks

Occasionally maligned and misunderstood; the scone is a quintessentially British classic.

Incredible scones, picture from Wikipedia

Recipe and serving suggestions follow.

Ingredients

- 350g self-raising flour, and a little spare for dusting
- ¼ tsp salt
- 1 tsp baking powder
- 85g butter, cut into cubes
- 3 tbsp caster sugar
- 175ml milk
- 1 tsp vanilla extract
- squeeze lemon juice (see Know-how below)
- beaten egg, to glaze
- jam and clotted cream, to serve

Method

1. Heat the oven to 220°C (or gas mark 7). Tip the flour into a large bowl along with the salt and baking powder, then mix it all up. Add the butter in, then rub the butter in with your fingers until the mix looks like fine crumbs. When that is done, stir in the sugar.
2. Put the milk into a jug and heat in the microwave for about 20-30 seconds. It should be warm but not hot. Add the vanilla and lemon juice to the milk and then put that to one side and but a baking tray in the oven to warm.
3. Make a well in the dry mix, then add the liquid and combine it quickly with a cutlery knife – it will seem pretty wet at first. Spread some flour onto the work surface and tip the dough out. Dredge the dough and your hands with a little more flour, then fold the dough over 2-3 times until it's smoother. Now put it into a round shape about 4cm deep.
4. Take a 5cm cutter (Pro-tip – smooth-edged cutters tend to cut more cleanly, giving a better rise) and dip it into some flour. Plunge into the dough, then repeat until you have four scones. By this point you'll probably need to press what's left of the dough back into a round to cut out another four.
5. Brush the tops with beaten egg, then place onto the hot baking tray.
6. Bake for 10 minutes until risen and golden on the top. Eat just warm or cold on the day of baking, generously (and I do mean generously) topped with jam and clotted cream.
7. If freezing, freeze once cool. Defrost, then put in a low oven (about 160°C) for a few minutes to refresh.

Responsive Web Design using the <meta> viewport

Introduce by Apple when released iPhone back in 2007. With this tag, a web page is rendered at actual size and can adjust the layout according to the device screen.

Lab 1 Guide and Task: Web Application Development

In modern web design, a web page needs to be responsive and render across different screen sizes. The viewport is specified as width or scale. For example,

<meta name=”viewport” content=”width=device-width, initial-scale=2.0” />

where width=device-width indicates width of the web page should be equal to the device width and initial-scale=2.0 indicates scale the content to twice the actual size. You may set minimum and maximum scale,

<meta name=”viewport” content=”width=device-width, minimum-scale=0.5, maximum-scale=3.0” />

Most responsive web design will set the meta tag to

<meta name=”viewport” content=”width=device-width, initial-scale=1.0” />

Set this to scone.html and check it out in web browser (adjust the size).

Responsive Web Design using media query

Media queries are crucial for a responsive web design. It can be used to alter some areas of your web page at certain viewport widths. Let’s look at a simple web page that showcase the use of media queries.

```
<!DOCTYPE html>
<html lang="en" class="no-js">
  <head>
    <meta charset="utf-8"/>
    <title>Media query example</title>
    <meta name="viewport" content="width=device-width, initial-scale=1.0"/>
    <style>
      body {
        background-color: grey;
      }
      @media screen and (min-width: 320px){
        body {
          background-color: green;
        }
      }
      @media screen and (min-width: 480px){
        body {
          background-color: yellow;
        }
      }
    </style>
  </head>
  <body></body>
</html>
```

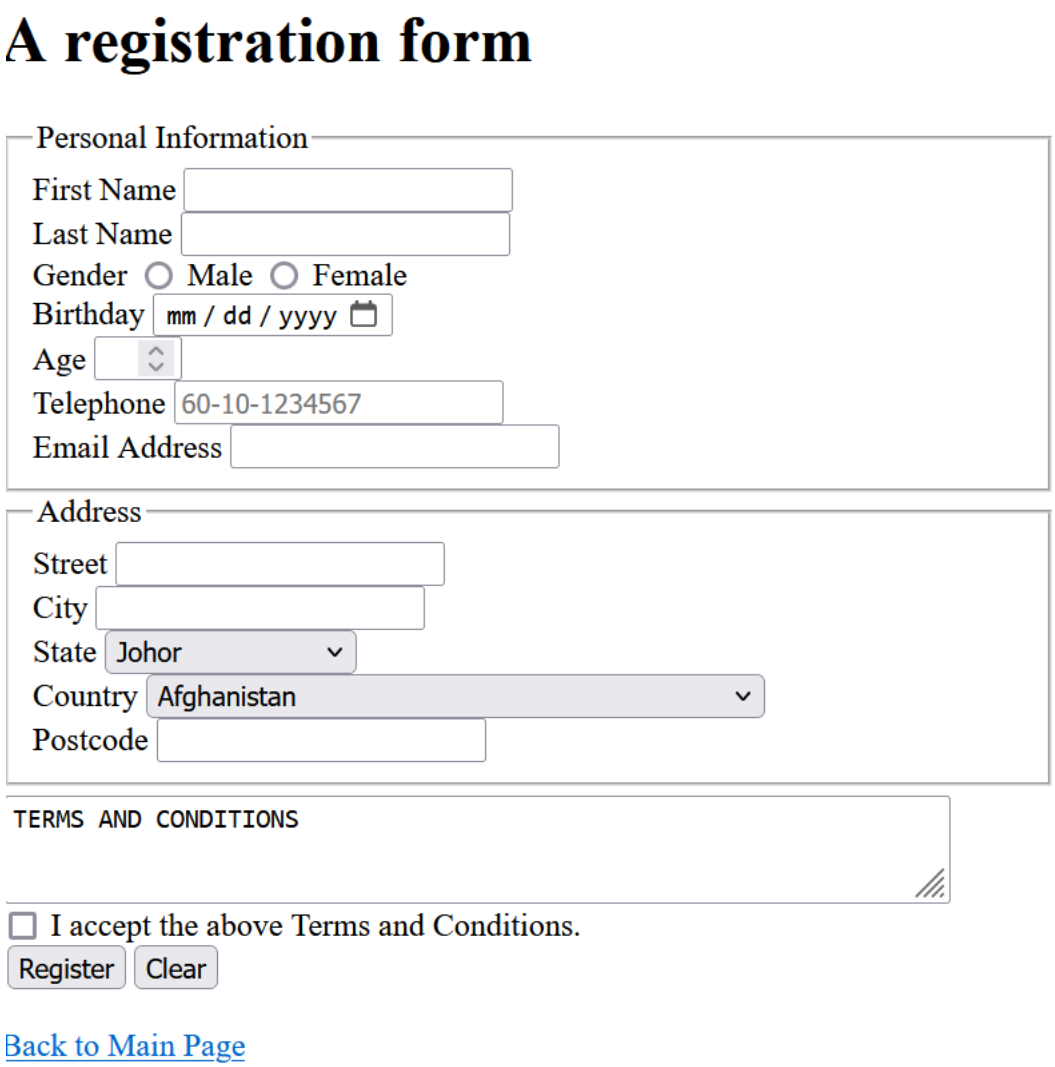

Now, add TWO additional media queries to set background color to orange when screen size is 767px and set background color to red when screen size is 960px. Test it out in web browser.

HTML Forms

Previously, JavaScript is needed in adding text placeholder, date pickers or sliders into HTML forms. Also, JavaScript code is needed to check the data enter into the form's fields by user and display errors if the data type is not the intended for each form's fields. HTML5 provides easier solutions to these problems. Find more HTML form related at https://www.w3schools.com/html/html_forms.asp

The incomplete version of form.html is provided. Add the missing form elements and set attributes' value correctly (min, max, placeholder, required, autocomplete, autofocus, etc).

Challenge

Challenge yourself by merging the use of multiple media queries to alter the background color for the scone / form example (without using JavaScript for now).
